

Main Version

Additional Horizontal Version

Building Information Modeling (BIM) is a digital representation of the physical and functional characteristics of a building. It is a process that involves creating and managing data for a building project, from the conceptual design phase to the construction and operation phases. BIM is a collaborative process that involves all stakeholders in the building project, including architects, engineers, contractors, and owners. It allows for the creation of a single source of truth for the building project, which can be used to make decisions and manage the project more effectively. BIM is a powerful tool that can help to improve the efficiency and quality of building projects.
